Cover: Image of a murine small intestine bearing tumours, showing lineage-traced clones (red) that express activated Dre recombinase fused to the human progesterone receptor (DrePr); nuclei are shown in blue. Clones within tumours are larger (right) than clones in adjacent epithelia (left), suggesting that clonal expansion within tumours is accelerated and that tumours inhibit clonal expansion in adjacent epithelia. See article by Thorsen et al. (dmm046706). Cover image is licensed under a Creative Commons Attribution 4.0 International license.
